# Looking to save on your monthly heating bills?

## Consider a Dual Fuel system

Combine a new or existing fossil-fuel furnace with an efficient, electric heating option and take advantage of our Dual Fuel Rate. You'll save money with a rate that's about half the price of our standard rate. Plus, rebates are available on most new electric heating technologies.

### Benefits of electric heating

**Clean:** No combustion or byproducts such as ash, dust, or flue gases.

**Efficient:** Electric heating is 100 percent efficient, and cold-climate heat pumps (CCHPs) are 200 percent to 400 percent efficient.

**Economical:** Many options have low initial and maintenance costs. And a well-planned system offers monthly savings.

### Electric heating technologies

**Plenum heater:** Air warms as it flows over heating elements inside the plenum. It works well in forced-air heating systems with ductwork.

**Cold-climate heat pump:** A CCHP can be installed as part of a new construction project or to replace a central air conditioner.

**Electric boiler:** Heats water distributed to radiators, hydronic baseboards, or in-floor hydronic heating systems.

**Supplemental electric heat:** Units such as baseboards, cove heaters, and radiant ceiling panels can be low-cost solutions for underheated areas.

Rebates and tax credits make upgrading your system affordable.
