Clean, quiet, and versatile

Thermal-storage heating systems generate and store heat in sand or ceramic bricks and release that heat as needed. They're a perfect match for our off-peak rates, which are 40 to 60 percent less than our standard electricity prices.

you can save
hundreds!**

Choose from several options

Room units

These heat-storage units are ideal for retrofitting homes without ductwork, heating a new addition, or warming a chilly spot.

Central storage furnace

A central storage furnace provide whole-house heating through a duct system.

Underfloor heat storage

Electric cables, panels, or hydronic tubing are buried in a bed of sand during construction. The system radiates clean, quiet, even heat.

Ask your HVAC contractor to help you plan your off-peak thermal-storage system installation.
